

# Platform Ramp

**Category A Easy**

1. The first step is to determine the overall dimensions of the wall and the area to be tiled. This will help you calculate the total number of tiles needed and the amount of adhesive and grout required. 2. Next, you should prepare the wall surface by removing any existing tiles or plaster, and ensuring that the surface is clean, flat, and free of moisture. 3. Once the wall is prepared, you should mix the adhesive and grout according to the manufacturer's instructions. 4. The next step is to lay out the tiles in a pattern that you desire. This can be done by starting with a central point and working outwards, or by starting from the bottom left corner and working upwards and across. 5. Finally, you should grout the tiles and clean the surface to remove any excess grout. This will result in a finished wall with a beautiful, textured appearance.
